I'm a full-stack web developer with experience in as many technologies as I can find the time to learn.

I've been gaining experience with Angular 7/Angular-cli, starting with my website and a side project I'm working on- although I'm still using Angular 1 on a couple of projects that don't currently warrant updates to ng-2. I'm still working a lot lately with jQuery and vanilla JavaScript in addition to Bootstrap 4 and SCSS on the front end. I'm now using PHP 7 on the back end, connecting to MariaDB databases. Of course, I also use all of the associated technologies that are available to me, like Grunt, Bower, NPM, Git for version control, etc.

I think responsive (and these days mobile-first) design is an absolute must given the amount of web traffic that comes from mobile devices, so I've used Mobify.js, Bootstrap's built-in (and awesome) breakpoints (and now Foundations... which I think I'm starting to like better than Bootstrap), HTML5 Boilerplate, or just CSS3 media queries to make sure everything I am involved with renders beautifully across as many devices as possible. Well, ok, lately I've used Bootstrap 4 pretty exclusively.

I have a strong eye for design and exacting attention to detail. I'm the guy whose eyes go immediately to the typo or to the often-misused "there", "they're", "its", "it's", or to the image that is just *one* pixel misaligned. These things drive me nuts! So I do tend to spend a not-insignificant amount of time finding and fixing these things. I suppose this makes me a bit of a perfectionist. I HAVE annoyed my fair share of QA engineers, who, after looking at the same thing for weeks, months, or even years just don't see them anymore.

I also find that working with others is tremendously rewarding, and the value of another pair of eyes can't be overstated! I have been guilty myself of missing something that is immediately obvious to another, simply because I've been staring at it for far too long.
